More about Kama Kush CBD

Pure fire and deep relaxation. The **Kama Kush CBD** from the renowned bank **Kannabia Seeds** It is an elite strain that makes you fall in love with its very high resin production and a strong effect. It will leave intense spicy notes and hints of tropical on your palate, enveloping you in a sensation of unsurpassed calm. It is the ultimate nighttime strain, widely acclaimed by those seeking a deep munchies state and total disconnection.

Flower appearance. Manicure will be a sticky task. Its flowers are hard as diamonds and have a spectacular density, ending their life cycle covered by a thick coat of white trichomes. With drops in temperature, it usually gives off beautiful purple and bluish tones.

Plant Morphology. It grows like a champ: short, squat and extremely robust. Its central trunk is notably thick, designed by nature to support the brutal weight of its central bud, and features enormous, dark green leaves.

Frequently Asked Questions

What is the ideal climate to grow Kama Kush CBD ?
His resistance is legendary. It adapts phenomenally to cooler, continental or mountainous climates, withstanding drastic drops in night temperature much better than equatorial varieties.

What training techniques work best with Kama Kush CBD ?
If you grow indoors, the SOG (Sea of Green) method is your best ally. By concentrating their strength in an immense central cola, placing dozens of these plants together will maximize the harvest per square meter without the need for complex pruning.

What type of fertilization does Kama Kush CBD need?
It is a rustic plant with a great appetite. In full bloom, it will gladly accept generous doses of phosphorus and potassium (PK) to harden its heavy flowers to the limit.

What should the irrigation and humidity be like for Kama Kush CBD ?
Since its flowers are an impenetrable wall, excessive humidity is its worst enemy. Water sparingly during flowering and keep oscillating fans moving the air to prevent botrytis.

Is it necessary to prune the Kama Kush CBD plant?
It appreciates a good leaf removal in the middle flowering phase. Remove the huge ‘fan leaves’ that provide shade will allow light to reach the low areas, fattening the satellite buds that would otherwise remain hollow.
